

Non-Road Certified Emission Standards

Baseline NO_x Emission Rate

For these calculations, the baseline NO_x emission rate will normally be the federal NO_x emission standard for the model year and horsepower of the baseline (old) engine. The federal NO_x emission standards for non-road equipment are presented in Tables below. In situations where the model year of the equipment and the model year of the engine are different, the model year of the engine should be used for determining the standard to apply.

In some model years, the EPA used a combined NO_x + NMHC (non-methane hydrocarbons) standard. For the standards listed in NO_x + NMHC, the TCEQ will use a NO_x fraction of 0.95 for diesel engines and 0.80 for alternative fuel engines to determine the NO_x-only emissions based on the combined standards.

¹ These standards are phased-in during the indicated years. At least 50% of a manufacturer's engine production must meet these standards during each year of the phase-in. Therefore, it is not guaranteed

that a Tier 4 (Phase-In) equipment and/or engine will meet the lower standard. If an applicant proposes to purchase a Tier 4 (Phase-In) equipment and/or engine, the applicant must certify, in the application, the emission level that the new equipment and/or engine will meet. Copies of the form certifying the engine family to the lower emission standard must be provided. If it is not yet known what emission standard to which the engine will be certified, then use the Tier 3 standard.

² The 0.50g/bhp-hr standard applies to gensets to over 1200 hp.

³ Applies to all gensets
